Name:
Please show all work. Supply brief narration and illustrations with your solutions and draw conclusions.

1. Find all critical points of $f(x)=x-x^{3}$ in the interval $-2 \leq x \leq 2$. Use $f^{\prime \prime}$ to determine whether they are local minima or maxima. Find the global minimum and maximum of $f$ of the interval and state where they occur. Sketch.
2. Find indefinite integrals of the following functions

$$
\begin{array}{ll}
\text { (a) } \frac{e^{-2 x}}{\left(1+e^{-2 x}\right)^{2}} & \text { (b) } t^{2} \cos (3 t)
\end{array}
$$

3. Determine whether the improper integral $\int_{1}^{\infty} \frac{d x}{x^{\frac{2}{3}}+x^{\frac{4}{3}}}$ converges or diverges. Justify your assertion by comparison to an integral whose convergence or divergence can be determined directly.
4. For the autonomous differential equation $d x / d t=x-a^{3} x^{4}$, where $a$ is a positive constant, draw the phase-line diagram, find the equilibria, and determine their stability.
5. Solve the Torricelli differential equation $d h / d t=-\sqrt{h}$ with initial condition $h(0)=5$. Sketch the solution and describe its long-term behavior.
